

Only Spot[®] Ex Endoscopic Tattoo Supports The ESGE Guidelines

*Prof. Cesare Hassan
ESGE guidelines co-author
Head of Endoscopy Unit
Nuovo Regina
Margherita Hospital, Rome*

Why Professor Cesare Hassan Tattoos

“Advances in screening and therapy are helping reduce colon cancer death rates across Europe. Polypectomy and EMR are now common skills for Gastroenterologists, and allow patients cancer prevention without the need for traditional surgery. The new ESGE guidelines recommend long-term follow-up of patients who have had these procedures to detect and treat recurrences in order to reduce the risk of interval cancer. In particular, these guidelines recommend tattooing any lesion suspicious of occult invasive cancer or those difficult to be detected at surveillance.

I am very happy to use Spot Ex in my practice because it is the only tattoo indicated for long-term clinical surveillance.”

Spot Ex is the **only** tattoo with a long-term clinical surveillance indication that enables you to implement the ESGE guidelines.

Choose Spot Ex Endoscopic Tattoo

ESGE guidelines: Clinical Surveillance and Surgical Localisation

Spot Ex Indication for Use¹

Spot Ex is indicated for endoscopically tattooing lesions in the GI tract for up to 36 months to facilitate clinical surveillance or surgical localization

1. Spot Ex Indication. Instructions For Use. G46-006 Rev02 April 2018

ESGE Guidelines For EMR and Polypectomy²

“Colonoscopic tattooing is performed to enable future identification, at colonoscopy or surgery, of malignant lesions (proven or suspected), polypectomy, EMR, or ESD sites, difficult-to-detect polyps, or dysplastic areas. All such lesions, other than those definitely located in the cecum, adjacent to the ileocecal valve, or in the low rectum, should be tattooed.

A sterile and biocompatible pre-packaged suspension ... (Spot) has been developed... and this has enhanced the accessibility, ease of use, and safety of the procedure.”¹
